Continuation of 3. NOTE: Newly added claims 25-27 raise new issues that would require further consideration and/or search.

Continuation of 11. does NOT place the application in condition for allowance because: In regards to independent claim 1, Applicant submits that because secondary reference Fukutoku includes a flicker-judging section (Fig. 8, item 12), this precludes the reference of Fukutoku from being enjoined with primary reference Moriyama since the current application does not involve a flicker-judging section (Remarks 11-12). This is not persuasive. The fact that Fukutoku includes a flicker judging section does not teach away from the claimed invention of the current application. In other words, Applicant's main invention is to prevent the formation of unwanted horizontal strips that are developed as a result of methods which prevent unwanted unflickering (sections [0020, 0023, 0028]). In particular, a checkered pattern is used to apply data to corresponding pixels in order to prevent flickering. The unwanted result of this, is that the difference of the total amount of written electric charge between the first and second horizontal synchronizing periods causes horizontal stripes to appear in every polarization inversion period (section [0023]). As mentioned in the final rejection of 4 August 2008, the majority of the claims are taught by Moriyama, with the exception of the newly amended claims of 4 June 2008 reciting "the polarity of the data voltage is not inverted after each horizontal synchronizing period (claim 1, lines 12-13)." Fukutoko teaches that the data voltage is not inverted after each horizontal synchronizing period (Fig. 3a, paragraph 104). The presence of the flicker judging section does not teach away from the claimed invention. In fact, the flicker judging section is consistent with the claimed invention, since both apparatus aims at reducing flickering. Hence the rejection of Fukutoku still stands.
